

Full Sling Calf Lifter

Stone Manufacturing Co.

Description:

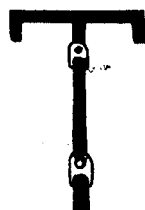

Made of heavy duty PVC strengthened with nylon webbing, the Cowlifter is designed to be attached quickly and securely to the front or rear-end loader of any tractor or block and tackle. The Cowlifter takes the trauma out of getting a cow back to its feet and transporting it from field to shed. A cow can be lifted comfortably for two to three hours - or longer - as long as it takes to start circulation and movement in the legs. The sturdy cradle-like device does away with pressure points, therefore there is no bruising or damage to nerve endings which may cause permanent injury.

The Cow lifter In Operation:

2

Roll animal on side and position sling under and over body with harness placed round udder, neck and legs.

3

Roll animal back over on belly, ensure that harness is correctly placed round legs and udder.

Animal in upright position.
