

AquaVet® Bio Pond Cleaner

AquaVet®

Your prescription for a **Healthy Pond**

All-In-One **Bio** Pond Cleaner
Featuring **BioStart™ Complex**

Cleans your pond faster

An **all-in-one** Bio-Stimulant & Systemic Pond Cleaner

Natural sludge & muck remover

100% safe for fish, waterfowl, livestock, pets & swimming—immediately after treatment

One Gallon

Treats One Acre 6 Feet Deep

For heavy muck over 12 inches treat every 30 days for 6 months. Every 60 to 90 days for maintenance.

A Shallow Water Solution that creates DEPTH by removing muck, sludge, and organic buildup from your lake or pond.

AquaVet BIO POND CLEANER with BioStart™ Complex gives your pond, lake or water feature a beautiful, natural depth.

Our concentrated water-soluble liquid formula of bacteria and enzymes is nontoxic and environmentally friendly. It enhances depth in shallow water conditions by breaking down and digesting organic buildup on the water's bottom.

BIO POND CLEANER features **BioStart™ Complex**, a first generation food complex uniquely formulated to give the spores of lake bacteria the start they need. This formula will densely cover your body of water with a rich blend of aerobic and an-aerobic cultures that are naturally occurring in lakes and ponds throughout the world. **BIO POND CLEANER** will aid in shallow water conditions by removing muck buildup, freeing up water depth and utilization of your body of water.

How does it work? BioStart™ Complex utilizes a proprietary blend of highly concentrated bacteria with superior enzymatic activity—specially designed to consume leaf debris, sludge, muck and nutrient loads.

Easy to use. Environmentally safe. 100% safe immediately after treatment. Nontoxic to fish, waterfowl, wildlife and livestock. Safe for swimming and irrigation.

Professional results for your pond. AquaVet products are used by Golf Course Professionals & Aquatic Managers.

DIRECTIONS: Each Gallon of Bio Pond Cleaner is formulated to **treat one full acre** of water 4 to 6 ft. deep.

Pour each gallon at several points around lake or pond. BioStart Complex spores are activated on contact with water.

NO irrigation or water restriction.

Hints For Success:

1. Treat new or problem ponds as soon as possible. For startup and problem ponds treat every 30 days..
2. BIO should be applied all year long at intervals of 60 to 90 days for max performance. Amount of muck, debris, nutrient loading, fertilizer runoff and outflow can impact this schedule. Treat to desired depth.
3. Optimal water temps are 60 degrees or higher. BIO can be added to ponds in winter, even in frozen ponds. Treatments can be placed at lower depth where water temps are a constant 40 degrees. The BIO formula contains cold water strains that metabolize at lower temps. The process is slower under 40 degrees, but the cold water strains continue to consume micronutrients.
4. Turbid water may have large amounts of organics and floating particulates which effect water color. BIO cannot consume inorganic material so it is important to know the difference. Turbid water contributes to poor aesthetics and can disguise muck problems. Re-treat until desired water depth is achieved.
5. For spills, wash hands and clothes with soap.
